proventeq

Content Discovery Service

Gain a deeper understanding of your business content with actionable insight reports

Remove the guesswork from document management and gain clear actionable insight from your content with our complete Content Discovery Service. This enables you to prepare the business case to move to a modern content services platform.

Underpinned by our industry-leading Content Insights tool, our Content Discovery Service will help you understand the incompatibilities and potential challenges between your existing and target systems. Empowering you to optimise your new target architecture and completely de-risk your project.

Benefits & outcomes

Reduce security risk with ROT analysis

Remove unwanted content and Redundant, Obsolete or Trivial (ROT) data to improve content architecture and prevent data breaches.

Boost ROI and increase operational efficiencies

Stop paying to store exponentially more data. By removing irrelevant data before migration, you reduce storage needs, cost and management time.

Uncover insights hidden in your unstructured data

Unfasten the hidden value within your structured and unstructured data to enhance business decision making through search and unstructured data analytics.

Build the business case for migration

In-depth Power BI reports will help prove your business case for migration to a modern content services platform and lay the groundwork for a secure environment.

"Working with Proventeq allowed us to figure out all of the different mechanics of how to restructure our data. This allowed us to have a clean break and start working immediately in the new system."

Honza Červenka
Internal Project Lead, McAlister Olivarius

Discovery & Analytics activities

Workshops	Content Discovery	Source content analysis	Actionable Insights Reports	Advanced consultancy
With business and technical users	Discovery of data from source repository	Identify issues and risks to migrate source data	Generate drill-down Power BI reports and recommendations	Additional analysis for complex or high risk environments

There are two levels to our Content Discovery Service, Standard and Advanced. But both follow the same delivery process. The level you require will depend on the level of reporting your business needs.

Standard Service

Content landscape reports
This describes the distribution of content on the system based on various dimensions of the data such as size, types, usage etc.

Content incompatibility reports
These reports highlight the compatibility of content stored in a source system compared to what is supported by a target system.

Advanced Service

The Standard Service plus:

Advanced metadata analysis
In addition to the system metadata, custom business defined metadata is discovered and analysed to understand its usage across the content repository and its impact on any planned migration.

Advanced security analysis
In addition to the high-level counts of security, detailed reports are available relating to the users and groups assigned to content and their allocated ACL.

Advanced workflow review
Review workflows (case management systems) and line of business application integrations in your existing system and recommend suitable alternatives available in a modern system.

Developing a deeper understanding of your business content is your first step toward a risk-free migration.
