Case study summary

DLF Limited are the largest commercial real estate developer in India, specializing in the development of commercial, retail and residential properties.

DLF continue to see exceptional growth in a highly competitive expanding market.

The challenges

**Understanding of existing content**
Content stored across FileNet repositories required analysis to identify errors, inconsistencies, and the often complex relationships surrounding DLF’s content.

**Vast content distribution**
Documents stored across multiple Object Stores and folders in FileNet P8 meant that content was often not correctly filed, related, secured or in context.

**Complex content architecture**
Content in FileNet repositories required segregation and migration to consolidated content types and different site collections in SharePoint Online.

**Granular security requirement**
DLF required the ability to restrict view, read and print permissions for respective internal departments and staff as well as a wide range of external stakeholders.

**Requirement for full fidelity**
A short timeframe was available for the project as the incumbent FileNet platform was planned to be retired within a 3 month period due to license expiration.

Mahesh Mathur  
Sr. Vice President - Systems & IT DLF Limited

“The transition to Microsoft Office 365 platform was swift and smooth and it has provided flexible distribution, management and collaboration of content.”
The results

Improved user productivity

By empowering DLF's users with a secure centralized search platform which allows restriction of search to specific content types for specific users within their customized SharePoint Online instance, Proventeq have helped reduce the time spent across the organization searching for and working with content.

This measure has also helped to negate the impact of having to replicate effort in storing and managing documents and rich media across disconnected on-premise platforms, allowing content to now be distributed to both internal staff and external stakeholders quickly and easily.

Robust information protection

Thanks to implementation of a granular SharePoint security model, DLF have met a key goal of controlling view, read and print permissions on externally-shared content. Migration Accelerator has also provided DLF the ability to apply Microsoft Azure Information Protection to high volumes of content across internal user and external stakeholders; strengthening the long-term security of shared content.

Reduced total cost of infrastructure

Due to an existing investment in Microsoft's Office 365 platform, DLF have found that by moving the content out of IBM FileNet P8 and decommissioning the IBM system there has been a significant reduction in the total cost of ownership of their ECM infrastructure. These savings have been generated by a 65% reduction in licensing costs and by negating the need for expenditure on modernizing and upgrading FileNet P8 to provide the functionality the organization required.

Make your content work smarter with Proventeq

Proventeq specialises in migration from non-Microsoft and legacy Microsoft systems to SharePoint. Our AI -powered migration and productivity solutions turn your SharePoint adoption challenges into opportunities.
